INSTALLATION

1. Remove (4) screws and temporary bottom plate at bottom of door.

2. Verify door swing and stand door against wall on appropriate side. Verify rough opening width and height.

VERY IMPORTANT (Floor Preparation):

Ensure that the floor under the door slab is flat and level. You may install a flat, level, and smooth threshold. If the existing floor is not flat, level, and smooth-the bottom door seal will not perform properly. **DO NOT** raise the hinge side of the jamb off of the floor. The factory undercut of the door is set to the proper height.

3. Cut bands that hold door together. Move door into rough opening by walking the door from left to right in small steps. Install door until back side of door trim is tight against face of wall.

*We Identify and **S.T.O.P.** Your Noise Problems*

INSTALLATION Cont.

- 5.** Remove (2) screws per hinge closest to door stop. Pre-drill and install heavy duty hinge screws provided into two hinge holes as shown. It is very important to make sure this side of door is plumb, adjusting with shims as necessary as you move from hinge to hinge. If the screws do not contact solid wood for required holding power it may be necessary to remove the door seal and install screws beneath the seal on the doorstop and reinstall it.

5A.

5B.

INSTALL TIP, IF SEAL REMOVAL IS NEEDED TO MAKE CONTACT INTO SOLID WOOD FRAMING:

To remove the door seal, remove the screws going through the seal into the wood doorstops. Install long screws through the wood doorstops. Be sure to countersink the long screws so that the door seals rest flat on the wood doorstops. Reinstall the door seal with the screws previously removed from the seal.

ADJUSTING SOUND SEALS

1. With door installed and latched, use a Phillips head screw driver and turn to adjust compression of neoprene seal against door. Keep compression moderate and do not over tighten. If seals are adjusted to tightly against door it will make closing and latching the door difficult.

2. Bottom drop seal comes factory set at its upmost position. With a Phillips screw driver gradually turn out screw in steps 90° or less at a time to increase seal pressure against floor. Watch as door closes and seal activates and contacts floor. Do not over increase pressure or damage to the seal may result.

VERY IMPORTANT (Floor Preparation):

Ensure that the floor under the door slab is flat and level. You may install a flat, level, and smooth threshold if the existing floor is not flat, level, and smooth. The bottom door seal will not perform properly. **DO NOT** raise the hinge side of the jamb off of the floor. The factory undercut of the door is set to the proper height.

ADJUSTING SOUND SEALS Cont.

- 3.** Install wood door seal covers. Peel backing from double sided tape. Install the top cover first. Applying pressure to areas with tape. Next install both sides.

INSTALL TIP: You may brad nail the wood seal covers into the wood door stop for permanent installation. Be sure to hit the wood stop with the brad nail.

INSTALL TIP: Please adjust bottom seal before installing jamb seal covers, if you are unsure that you have adjusted the jamb seals correctly.

IMPORTANT: Once you have put jamb seal covers on, they are not meant to be removed for additional adjustments.

- 4.** Fill all nail and screw holes with the wood putty (not included).

Your install is now complete and ready for stain or paint finishing.
