This test method conforms explicitly with the American Society for Testing and Materials Test Method: Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements - Designation: E 90 - 04 / E 413 - 04. Specimen Description: The test specimen was a partition assembly constructed within the 12 ft. Wide by 9 ft. High (3657mm W by 2743mm H) test opening. The test specimen was described by client as, chase walls with metal stud framing 24 in. on center with a 1 in. air gap between them. The source side had a single layer of SoundBreak® gypsum board .Mineral wool insulation placed into the cavities formed by the framing members on source side. A single layer of 5/8 in. gypsum board was placed on the receive side of the assembly. Standard direction of sound from Source Room (Room 1) to Receiving Room (Room 2). The wall system was constructed in the test opening and consisted of: From Room 1 to Room 2. - 1 Layer of 15.9mm (5/8 in.) SoundBreak® gypsum wallboard. Sample weight was 13.7 kg/m² (2.7 PSF) mounted vertically and applied directly to the metal framing members. Screw spacing was 203mm (8 in.) on center around the perimeter and 304.8mm (12 in.) on center in the field with 41.3mm (1-5/8 in.) fine thread bugle head drywall screws. - 1 Layer of 76.2mm (3 in.) mineral wool insulation was friction fit into stud cavities. The sample weight was found to be 3.0 kg/m² (0.62 PSF). Placed on source side only. - 63.5mm (2-1/2 in.) wide by 31.2mm (1-1/4 in.) thick metal studs mounted vertically

- 609mm (24 in.) on center between the top and bottom tracks 0.88 kg/m² (0.18 PSF). A 38mm (1-1/2 in.) cold roll channel was placed through stud knock-outs at mid-height.
- 63.5mm (2-1/2 in.) wide by 31.2mm (1-1/4 in.) thick metal track 0.34 kg/m²
 (0.07 PSF). A bead of acoustical caulk was placed between the tracks and test assembly.
- A 25.4mm (1 in.) air gap was placed between the two studded walls, forming a chase.
- 63.5mm (2-1/2 in.) wide by 31.2mm (1-1/4 in.) thick metal studs mounted vertically 609mm (24 in.) on center between the top and bottom tracks 0.88 kg/m² (0.18 PSF). A 38mm(1-1/2 in.) cold roll channel was placed through stud knock-outs at mid-height.
- 63.5mm (2-1/2 in.) wide by 31.2mm (1-1/4 in.) thick metal track 0.34 kg/m² (0.07 PSF). A bead of acoustical caulk was placed between the tracks and test assembly.
- 1 Layer of 15.9mm (5/8 in.) Type X gypsum wallboard. Sample weight was 11.2 kg/m² (2.3 PSF) mounted vertically and applied directly to the metal framing members. Screw spacing was 203mm (8 in.) on center around the perimeter and 304.8mm (12 in.) on center in
- ' the field with 41.3mm (1-5/8 in.) fine thread bugle head drywall screws.

Total weight of the wall system was 29.9 kg/m² (6.12 PSF)

The perimeter of the wall system was sealed with acoustical caulk and exposed board joints were taped.

Test Results:
